Initial idea

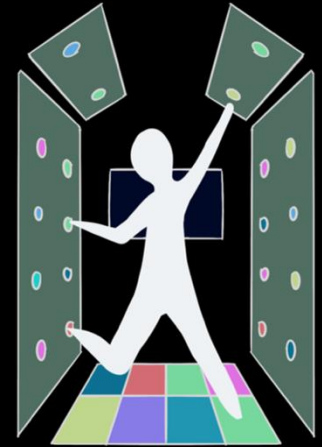

Inspired by JoJo Bizarre
Adventure and red carpet
aesthetics

Imitating poses on screen in
order to get photographed

Walls with buttons as input to
keep high level of physical
challenge

Relied heavily on graphics

JOJO REFERENCE?

Major iterations: poses VS single button prompt

Originally, we wanted the game to give **complete poses** as prompts

This would guarantee that the poses are good looking and possible to do

However, it was hard to achieve non-repetitive gameplay without preparing **30+ assets**

Additionally, it was hard to visually explain which buttons belong to the pose

Final iteration has **single button prompts** combined in sequences

Game now focuses on **how to rearrange limbs** to keep pressing all the requested buttons at the same time

Game gets progressively harder once the **number of prompts** per sequence **grows**

The game turned out to have **complex randomization algorithm** to prevent our players from getting impossible combos

Major iterations: booth

Originally, we wanted the booth to have buttons above players' heads

The development started with the idea of having a wooden wall which was hard to make stable and transportable

Pressure distribution was a major problem if using wood or stretchy fabric

The game was supposed to be possible to play for as many heights as possible, so we removed the top part

Game now uses fabric as a basis for buttons which makes it way lighter

We managed to find a non-stretchy piece and connect it with elastic cords to make sure the pressure is equally distributed

Goal achieved?

Bizarre poses?

Yes. You'll see on the following slides how poses are unique in this game. Also, each person uses their body in their own way

Physically challenging?

Yes. An average game session is around 3-4 min, and the main reason is that players grow tired

Aesthetically satisfying?

Yes. We've managed to move the focus from the screen to the booth thanks to button arrangement and SFX supporting blind playing

A large, stylized white letter 'L' with a thick, dark purple outline. It is positioned on the left side of the slide, next to a small purple star icon.A large, stylized white letter 'R' with a thick, dark purple outline. It is positioned on the right side of the slide, next to a small purple star icon.

Play session

Work strategy

Daily SCRUM

We did it on a daily basis, the same time everyday. That helped keep track of other team members' workload and dependencies

In-person work sessions

Even though we didn't have many of those, it was always highly productive due to us being all in one space and capable of directly communicating

Custom JIRA fields

We decided to have our DoDs on the JIRA board in order to manually check for passing those criteria when moving tasks cards around

Post-mortem

Worked well	Didn't go well
Builder had team's trust Clear description of the code Daily SCRUM for keeping track of each member's workload and startistics on how much people tend to work Shared working sessions: getting instant feedback, discussing design decisions. Ideation part benefited from this	Dependencies and unclear task destribution Game design meetings were heavy on people. Could have been splitting into smaller groups There was not enough playtested itarations Not having documentation Not asking PO enough questions
